ILLUSTRATIVE TEXT FOR TESTING - NOT AN OFFICIAL RWANDA FDA DOCUMENT

GUIDELINES ON REGISTRATION OF FOOD PRODUCTS
Version 2026-01

1. Food safety certificate
The manufacturing site must hold a valid food safety management certificate, such as HACCP, ISO 22000 or FSSC 22000, issued by an accredited certification body. The certificate must name the site and must be valid on the date of submission.

2. Certificate of analysis
The certificate of analysis is for a named batch of the product. It shows the batch number, the date of analysis, and the results of each test against its specification limit, including microbiological tests (for example total plate count, coliforms, Salmonella, yeasts and moulds).

3. Composition
The composition lists every ingredient with its quantity or percentage. Fortified foods state the amount of each added vitamin and mineral per 100 g.

4. Labelling
In addition to the general labelling guidelines, the label of a food product lists the ingredients in descending order of weight, declares allergens, and states the net content. Fortified foods and food supplements give nutrition information per 100 g or per serving.
